

- 01 Initial Consultation with General Dentist**
  - The dentist identifies the need for a dental implant and provides the initial evaluation, including X-rays or scans.
  - Refers the patient to a surgeon for implant placement.
- 02 Referral to Oral Surgeon**
  - The general dentist sends the referral, and the patient schedules a consultation or virtual care coordination session with the surgeon.
- 03 Evaluation and Treatment Planning**
  - The oral surgeon performs a comprehensive evaluation, including imaging (e.g., CBCT scan), and develops a personalized treatment plan.
- 04 Pre-Surgical Preparation**
  - The patient completes any necessary preparatory procedures, such as extractions or bone grafting (if needed), and provides medical history and consents.
- 05 Implant Placement Surgery**
  - The surgeon places the implant(s) during a single procedure, typically under local anesthesia or sedation.
  - Post-surgical instructions and follow-up care are provided.
- 06 Healing and Osseointegration**
  - The implant integrates with the bone during this period.
  - Temporary restorations may be placed for aesthetic and functional purposes.
- 07 Post-Surgery Follow-Up with Surgeon**
  - Follow-up visits to monitor healing and confirm implant stability.
- 08 Referral Back to General Dentist**
  - Once the implant is stable, the patient returns to their general dentist for final impressions and restoration.
- 09 Final Restoration Placement**
  - The general dentist places the crown, bridge, or denture on the implant, completing the process.
- 10 Routine Maintenance and Follow-Up**
  - The patient visits their general dentist for regular check-ups and hygiene appointments to maintain implant health.
